

Non-Technical Manager Briefing

A simulated cyber security attack was conducted in a controlled lab environment to test the organization's monitoring and incident response capabilities. During the exercise, a vulnerable service on a test machine was successfully exploited, allowing unauthorized remote access. Security monitoring tools detected suspicious activity and generated alerts for analysis. The incident response process included investigation, monitoring, and containment using CrowdSec to block the attacker IP address. Wazuh SIEM was used for centralized visibility and event analysis. The exercise demonstrated the importance of proactive monitoring, timely incident response, and evidence preservation in protecting organizational systems against cyber threats.
